

To place “*soffit*” on canopies or rake extensions, you simply modify the proper condition at the “*Liner*” folder. As with most VPCCommand functions, you can build your preferred “soffit” conditions into your “Default” projects so that when you add a canopy or rake extension, soffit will automatically be provided.

The screen shown below will apply soffit to all canopies on the VPCCommand file. If you wish to designate differing soffit conditions, simply go into the proper shape and canopy or rake extension.
